In many domains, artificial intelligence (AI) is moving from experimentation to real deployment, reshaping regulation, innovation and public-sector capability. This country profile examines how Switzerland is preparing for the EU Artificial Intelligence Act, highlighting progress in data governance, high-performance computing and responsible AI adoption across

sectors such as health, mobility and the bioeconomy. Key challenges remain: expanding supervisory capacity, clarifying requirements for SMEs, strengthening conformity pathways and ensuring transparency. By investing in skills, coordination and shared standards, Switzerland can ensure AI supports anticipatory, trustworthy and resilient governance.

Switzerland: A Hub for Robotics and Sovereign AI

Yonah Welker

*Public
Technologist*

Robotics and AI Infrastructure

Switzerland is emerging as a “Silicon Valley of robotics,” with a thriving ecosystem of 30+ startups, leading research at EPFL, and companies like ANYbotics. Its sovereign AI capabilities are supported by cutting-edge infrastructure, including ETH Zurich’s Apertus open, multilingual LLM and the CSCS Alps supercomputing system, which offers 10,000+ GPUs. The Swiss AI Initiative further accelerates development through grants exceeding 10 million GPU-hours, enabling large-scale AI research and experimentation.

Interoperability and National Platforms

Swiss programs such as the Swiss AI Initiative, Innosuisse innovation programs, and the Digital Switzerland Strategy leverage national research infrastructures (ETH Domain, CSCS) to advance applied AI, robotics, and hardware development. These platforms provide neutral environments to test interoperability, align systems with EU standards under the AI Act, and support technical standards, conformity assessments, and secure data spaces.

Sandboxes and Experimentation

Switzerland promotes safe AI experimentation through initiatives like Zurich's AI Innovation Sandbox, offering controlled environments for piloting high-risk or public-sector AI. These sandboxes complement EU regulatory sandboxes (AI Act, Art. 57), enabling testing under clear guardrails while generating evidence for compliance.

Transparency and Accountability

Instead of mandatory labeling, Switzerland emphasizes traceability, documentation, and accountability through the revised Federal Act on Data Protection, consumer protection law, and ethical guidance from the Federal Council and ETH Domain, ensuring responsible AI deployment.

AI Governance for Human-Centric Implementation

**Dr. Martha
Boeckenfeld**

*Board and
Executive Advisor*

Swiss executives face a narrowing window: comply with the EU AI Act and the forthcoming AI Convention without sacrificing the agility that defines this innovation hub. The recurring questions I hear in boardrooms are blunt—how do we classify and govern high-risk systems at speed, how do we adopt powerful models without trust erosion or regulatory surprises, and how do we handle workforce transformation before it becomes a retention crisis?

In Switzerland's evolving AI landscape, true progress hinges not just on regulatory alignment but on embedding human-centric principles at the core of governance. Executives grappling with these demands often face a triad of pain points: navigating compliance without hampering agility, mitigating risks in tech adoption that could erode trust, and addressing workforce shifts that AI inevitably triggers. Drawing from my work in ethical tech and human factors, I've seen how these challenges, if unaddressed, can stall innovation—yet, when tackled thoughtfully, they become catalysts for resilient growth.

Consider regulatory compliance: Switzerland's reliance on the FADP and forthcoming AI Convention ratification offers a flexible foundation, but executives need practical tools like tailored risk assessments to classify AI systems and ensure traceability.

This isn't about box-ticking; it's about fostering accountability that protects users while allowing SMEs to thrive amid EU interoperability demands. Tech adoption risks, such as bias in health or mobility applications, demand proactive measures—deploy lifecycle-integrated ethical audits in sandboxes like Zurich's to test real-world impacts before scale-up. I've witnessed deployments delayed 12–18 months over unaddressed bias findings, underscoring the urgency.

Workforce impacts loom largest: AI's rise in sectors like bioeconomy could displace roles, with studies showing 15–25% shifts in regulated industries within three years if upskilling lags—yet it also unlocks opportunities. Governance must prioritize human-AI collaboration, with policies that mandate transparency in automated decisions and invest in reskilling programs via Innosuisse. By centering people—through inclusive design that integrates diverse stakeholder input from day one—Switzerland can avoid the pitfalls I've seen elsewhere, where unchecked AI led to eroded morale and legal fallout. Instead, this approach builds anticipatory frameworks that align tech with societal values, turning potential liabilities into a competitive edge for trustworthy, human-empowered innovation.

The window to shape Switzerland's human-centric model closes in 2026–27. Boards that act now—starting with lightweight ethical audits and targeted reskilling—won't just comply; they'll define the trustworthy AI benchmark the EU and beyond will follow.

Executive Summary

This report examines how the Switzerland is translating the EU Artificial Intelligence Act into national policy and enforcement practice. It highlights Switzerland's overall readiness, early implementation measures, and sectoral exposure to AI regulation. The overview summarises key institutional developments, major opportunities for innovation, and the central challenges shaping the national AI governance landscape.

- Switzerland lacks dedicated AI laws, relying on existing frameworks like FADP while advancing AI Convention ratification via a 2026 bill for transparency and rights protection.
- Distributed oversight by FDPIC, FINMA, Swissmedic emphasizes sectoral enforcement, guidance, and testbeds through CNAI for compliance readiness.
- Ecosystem leverages research hubs, public procurement, and non-binding measures to boost innovation and EU interoperability.
- Recommendations prioritize assurance scaling, SME toolkits, harmonized standards, and MOUs for efficient market access.

Switzerland's AI governance advances toward 2026 as the Federal Council moves to implement the Council of Europe's AI Convention through new legislation on transparency, data protection, and non-discrimination. While no AI-specific laws yet exist, current obligations arise under the Data Protection Act and sectoral frameworks such as banking and medical devices. The forthcoming federal bill—drafted by the FDJP, DETEC, and FDFA—will shape oversight and trust standards, supported by non-binding measures. Businesses operating in Switzerland must anticipate hybrid regulation that balances innovation, fundamental rights protection, and interoperability with emerging EU and international AI governance frameworks.

AI & Partners

Amsterdam - London - Singapore

Who Are We

AI That You Can Trust

Why Us?

Stay on the right side of history. At AI & Partners, we believe AI should unlock potential—not cause harm. We've seen the fear and fallout when teams lose control of AI, but also the trust and innovation that follow when it's handled responsibly. That's why we exist: to help you build AI you can trust and stand behind—for the long run.

80%

of AI systems
are unknown

What Do We Do?

We enable safe AI usage—for your organization and your clients. Unknown AI adoption leads to confusion, risk, and reputational damage. We help you take control with tools to identify, monitor, and govern all AI systems—so you're not reacting to AI, you're leading it.

How Do We Do It?

Do you know what AI systems you have? Identify all known and unknown AI systems (algorithms, LLMs, prompts, and models) from all internal and external AI vendors, automated by generating your inventory. Overall, 80% of AI inventory is unknown to our clients.

How do you guarantee ongoing safe AI use? Continuously monitor deployed AI systems for performance drift, anomalies or failures, real-world impacts, and emerging risks (e.g. data poisoning). Any malfunction of an AI system has severe implications for organisations (e.g. inability to assess online misinformation that leads to widespread public mistrust), so monitoring becomes a matter of urgency.

AI Discovery & AI Inventory

Automatically detect all AI systems, including models, algorithms, and prompts, and maintain a live, always-updated register for full visibility and compliance.

Responsible AI

Embed fairness, transparency, and control into every stage of AI use—aligning with the EU AI Act and building 'Trustworthy-by-Design'.

Model Monitoring

Continuously track your AI models after deployment to detect drift, bias, or failure—so you stay in control and prevent harm before it happens.

Contents

This section provides a structured overview of the report's organisation, guiding readers through the main areas of analysis. It lists each major section and its focus—ranging from strategic and policy developments to regulatory implementation and market readiness.

National Strategy & Policy Framework

Following the anticipated public consultation on the draft bill by the end of 2026, the post-consultation version enters Switzerland's parliamentary process, marking a pivotal step in aligning national law with the Council of Europe's Framework Convention on Artificial Intelligence, Human Rights, Democracy, and the Rule of Law (AI Convention). This phase integrates feedback from stakeholders, refining proposed amendments to existing Swiss laws in critical areas like transparency, data protection, non-discrimination, and oversight mechanisms to safeguard fundamental rights. The Federal Department of Justice and Police (FDJP), collaborating with the Department of the Environment, Transport, Energy and Communications (DETEC) and the Federal Department of Foreign Affairs (FDFA), leads this effort, ensuring the bill reflects the Federal Council's strategic objectives: bolstering Switzerland as an AI innovation hub, protecting economic freedoms alongside personality rights, and enhancing public trust through reliable AI governance.

Swiss Parliamentary Framework Overview

Switzerland's Federal Assembly, comprising the National Council (200 members) and the Council of States (46 members representing cantons), handles legislative review in a bicameral process that emphasizes

consensus and federal balance. Post-consultation, the Federal Council formally submits the refined bill, triggering committee examinations where specialized commissions—such as those on legal affairs or economic matters—analyze technical details, solicit expert input,

and propose modifications. This stage often spans several months, involving public hearings and inter-party negotiations to address concerns over innovation constraints versus rights protections, particularly in sectors like finance, healthcare, and transport where AI intersects with existing regulations. The process prioritizes technology-neutral adaptations, avoiding broad horizontal rules akin to the EU AI Act, and focuses legislative changes on Convention-mandated areas affecting fundamental rights.

Debates in plenary sessions follow committee reports, requiring simple majorities in both chambers for passage, with the originating chamber yielding to the second on disputes via a conference committee. Potential delays arise from optional referendums, where 50,000 signatures can force a public vote, a mechanism that underscores Switzerland's direct democracy tradition and could extend timelines beyond initial projections. This participatory element ensures broad legitimacy but demands robust stakeholder engagement from businesses, academics, and civil society to preempt challenges.

Alignment with AI Convention Requirements

The bill's core aim integrates the AI Convention—signed by Switzerland on March 27, 2025—into domestic law, mandating risk assessments across AI lifecycles to mitigate harms to human rights, democracy, and rule of law without imposing outright bans or extensive private-sector burdens. Key amendments target gaps in current frameworks: enhancing transparency obligations under the Federal Act on Data Protection (FADP) for automated decisions; bolstering non-discrimination via civil liability expansions; and introducing oversight for high-impact public-sector AI uses. For private entities, implications remain limited, emphasizing self-regulation supplemented by sector-specific tweaks—e.g., FINMA guidelines for AI in banking or Therapeutic Products Act updates for medical devices—while promoting voluntary measures like industry self-declarations.

This limited implementation strategy, endorsed February 12, 2025, contrasts with more prescriptive models elsewhere, preserving flexibility for Swiss firms in global markets. Coordination with EU developments proves essential, as exporters of high-risk AI must navigate conformity assessments abroad, influencing domestic provisions on traceability and

explainability. By end-2026, parallel non-binding plans from DETEC, FDJP, and EAER will operationalize trust-building tools, such as ethical guidelines, feeding into parliamentary deliberations.

Key Areas of Legal Amendments

Targeted reforms span multiple statutes. Data protection sees strengthened automated processing rules, aligning FADP with Convention Article 2's AI system definition—a machine-based entity inferring outputs influencing environments. Liability frameworks may extend to AI-induced harms, clarifying accountability for developers, deployers, and users without novel risk categories. Employment law could address AI surveillance limits under the Labour Act, responding to motions for worker information rights amid opaque decision-making.

Intellectual property adjustments tackle AI-generated content ownership, while criminal provisions counter misuse like deepfakes. Horizontal elements focus solely on personality rights, with sectoral deepening in regulated fields: e.g., enhancing robustness requirements for AI in transport under DETEC oversight. These changes ensure compliance without stifling innovation, as existing laws like the

Constitution already impose trustworthiness on AI processes.

Stakeholder Implications and Preparations

Businesses face no immediate upheavals, as AI remains governed by "traditional" rules—Data Protection Act, civil/criminal liability—pending ratification. Enterprises should audit AI deployments for Convention alignment, prioritizing documentation, bias mitigation, and impact assessments, especially in cross-border operations. Engagement during consultation and parliamentary phases proves crucial, influencing outcomes via position papers or alliances like the Swiss Bankers Association, which endorses the sector-specific path.

Public trust hinges on demonstrable safeguards, with non-binding measures fostering voluntary adoption. Investors and AI firms benefit from Switzerland's innovation-friendly stance, potentially amplified by the planned 2027 Geneva AI Summit, showcasing regulatory maturity. Monitoring parliamentary progress, expected post-2026 consultation into 2027 sessions, equips stakeholders for enforcement via existing regulators like FINMA or FDPIC, with penalties tied to amended laws.

Broader Strategic Context

This parliamentary entry advances the Federal Council's 2023-2027 AI priorities, rejecting comprehensive regulation for targeted evolution. It positions Switzerland amid global flux—EU AI Act enforcement, US state variations—favoring interoperability via Convention ratification. Success hinges on balancing objectives: innovation via minimal private obligations, rights via precise amendments, trust via transparency. Delays from referendums or EU harmonization needs remain risks, but the process fortifies Switzerland's AI ecosystem resilience.

Enforcement Architecture & International Cooperation

Switzerland employs a decentralized, sector-specific supervisory approach for AI, leveraging existing federal authorities without establishing a dedicated horizontal regulator. Oversight integrates data protection enforcement via the Federal Data Protection and Information Commissioner (FDPIC), sectoral regulation through bodies like FINMA for finance and Swissmedic for therapeutics, and coordination by departments such as FDJP, DETEC, and FDFA to implement AI Convention requirements. This model channels transparency and fairness obligations through FDPIC under the Federal Act on Data Protection (FADP), while safety, market integrity, and domain risks fall to specialized agencies with statutory remits in banking, medical devices, and transport.

Practical implications emphasize technology-neutral adaptations: FDPIC issues guidance on AI-driven automated decisions and Data Protection Impact Assessments (DPIAs); DETEC coordinates public-sector AI strategies via the Competence Network for Artificial Intelligence (CNAI); sectoral regulators like FINMA apply existing

rules to AI in financial services, including risk management and explainability. The Swiss Bankers Association supports this path, advocating self-regulation alongside guidelines. Non-binding measures from DETEC, FDJP, and EAER, due by end-2026, will provide toolkits for trustworthiness, traceability, and robustness.

Enforcement Mechanisms and Tools

Switzerland's enforcement relies on extant legal powers rather than new AI statutes, combining guidance, audits, inspections, and sanctions under current frameworks like FADP, civil liability, and criminal codes. FDPIC wields investigatory powers for data breaches, imposing fines up to CHF 250,000 and remedial orders; sectoral authorities enforce via permits, approvals, and prohibitions—e.g., Swissmedic under the Therapeutic Products Act for AI medical devices, FINMA for algorithmic trading compliance. Post-ratification, Convention-aligned amendments introduce targeted tools for non-discrimination and oversight, with penalties tied to amended laws.

Key pathways include anticipatory guidance and sandboxes: FDPIC publishes AI-specific expectations for DPIAs and logging; DETEC's Digital Switzerland Strategy 2025 orients federal AI use with binding administrative rules. Audits demand access to models, datasets, and decision logs, enabling remediation before sanctions. Joint test environments, potentially via CNAI, facilitate technical validation of high-impact systems. Sanctions range from enforcement notices and product restrictions to criminal

liability for misuse like deepfakes, exercised by prosecutors or sector watchdogs.

Inter-Agency Structures

Coordination

Distributed oversight necessitates robust coordination, achieved through Federal Council-led workstreams and departmental collaboration. FDJP, DETEC, and FDFA jointly draft Convention-implementation bills, ensuring aligned interpretations on transparency and rights protection. Policy coordination occurs via the Federal Council's AI strategy, balancing innovation, rights, and trust, with EAER input on research ethics. Operational alignment leverages existing platforms like inter-departmental committees for shared risk assessments and evidence pooling in cross-sector cases.

For complex investigations, secondments and taskforces combine legal, technical, and sectoral expertise—e.g., FDPIC with FINMA on biased lending algorithms. This enables consolidated evidence requests from deployers, joint inspections for multi-domain harms, and unified engagement for providers facing overlapping scrutiny. Referendum risks during ratification add a democratic layer,

potentially delaying but legitimizing enforcement architecture.

Guidance, Inspections, and Early Compliance

Switzerland prioritizes "guidance-first" interventions to build capacity pre-enforcement, with FDPIC leading on data governance via advisory tools and DPIAs for AI profiling. Sectoral plans emerge organically: FINMA guidelines for AI robustness in banking; Swissmedic validations for therapeutic devices. Early activities encompass publishing explainability standards, piloting sandboxes through CNAI projects, and regulator-led audits to identify gaps in traceability.

Technical enablers include shared labs for model stress-testing and repositories of test cases, supporting investigations into autonomy and adaptiveness per the Convention's AI definition. Compliance ramps via voluntary self-declarations in non-binding measures, fostering trust before mandatory rules activate post-parliamentary passage.

International Cooperation Pathways

Switzerland pursues multilateral alignment via the AI Convention, signed March 27, 2025, providing a basis for cross-border standards and investigations on human rights impacts. Regulatory dialogues with

EU counterparts—e.g., on FADP-EU AI Act interoperability—facilitate intelligence exchange and mutual assistance. Bilateral arrangements enable evidence-sharing for extraterritorial FADP applications, with FDFA supporting security-related probes.

The planned 2027 Geneva AI Summit amplifies cooperation, positioning Switzerland as a hub for global dialogues. Implications for providers: aligned practices ease market access, but parallel processes—domestic audits plus foreign requests—demand robust documentation. National security cases leverage federal intelligence for evidence collection.

Practical Implications and Evolution

Front-line enforcement stays sectoral and evidence-driven: FINMA/Swissmedic handle domain risks, FDPIC privacy spans sectors. Guidance precedes sanctions, with sandboxes and toolkits enabling remediation. Technical infrastructure via CNAI and testbeds proves essential for auditing adaptive systems.

Cross-border ties grow through Convention networks, though national priorities may fragment approaches—necessitating MOUs for swift exchanges

EU AI Act Applicability & Compliance Pathways

Switzerland faces a similarly complex compliance landscape as non-EU providers under the EU AI Act, given its close economic ties and digital integration with the EU. Swiss AI providers and deployers, whether established domestically or abroad, are subject to extraterritorial obligations when their AI systems are placed on the EU market or their outputs are intended for use within the EU. This means that Swiss companies offering AI products or services accessible to EU users must comply with the stringent requirements of the EU AI Act, independent of where development or hosting takes place, reflecting the Act's broad definitions of "provider," "deployer," and intermediaries.

To meet these obligations, Swiss companies typically appoint authorised representatives within the EU to act as formal compliance contacts. This is essential for Swiss entities without an EU presence but marketing AI systems to EU clients. Importers and distributors within the EU also assume specified duties, including labeling, traceability, and cooperation with authorities, crafting a clear compliance pathway. Swiss firms must coordinate with EU

partners along these supply chains to define accountable parties under the Act and ensure documentary coherence.

The EU AI Act applies a risk-based classification for AI systems. Some applications, such as those involving prohibited practices, are outright banned. High-risk systems—like those used in critical infrastructure, law enforcement, or biometric identification—face mandatory conformity assessments,

comprehensive technical documentation, risk management systems, and post-market monitoring, with possible third-party conformity involvement. For lower-risk or transparency-only AI systems, compliance entails disclosing specific AI uses to users and maintaining basic documentation. For Swiss providers, early and meticulous risk classification according to the Act's taxonomy is key to avoid compliance pitfalls and regulatory delays when interfacing with EU markets.

Swiss firms planning to export AI solutions to the EU often follow a detailed compliance process aligned with EU expectations:

1. Cataloguing AI systems, data usage, user demographics, and EU exposure is the first step, identifying whether systems are marketed, integrated into products, or targeted at the EU market.
2. Appointing an EU authorised representative is required for Swiss providers without an EU establishment, formalizing their regulatory liaison.
3. Determining the conformity route—whether self-assessment suffices or third-party evaluation is

mandatory—based on the AI system's risk and use-case.

4. Preparing exhaustive technical dossiers documenting system descriptions, training data, risk assessments, testing logs, version histories, and mitigation strategies.
5. Implementing required transparency disclosures, especially when AI systems generate content, involve biometric categorization, or affect significant decisions.
6. Ensuring robust data governance and lawful cross-border data transfers, including Transfer Impact Assessments and safeguards such as Standard Contractual Clauses or adequacy rulings.
7. Establishing post-market surveillance and incident reporting mechanisms to detect, report, and remediate safety incidents or breaches within mandated EU timeframes.

These steps dovetail with Switzerland's regulatory approach which is largely guidance-driven and emphasizes proactive operator engagement.

Regarding conformity assessments for high-risk AI, Swiss providers must prepare full evidence packages demonstrating rigorous risk assessment, validation, robustness and security, and human oversight. When third-party conformity is obligatory, providers should budget time and funds accordingly. Even for self-assessed products, Swiss authorities cooperating with EU regulators may request access to technical files, logs, and test artifacts during inspections. Retaining thorough, reproducible test cases, version control records, provenance documentation, and clear design decision logs is essential for responding to regulatory inquiries efficiently.

Switzerland's regulatory architecture mirrors the UK's distributed, sectoral approach to AI oversight, with multiple authorities playing complementary roles rather than a single horizontal regulator. The Federal Data Protection and Information Commissioner (FDPIC) leads on data protection, transparency, and fairness under the Federal Act on Data Protection (FADP), while domain-specific agencies like FINMA (finance) and Swissmedic (medical devices) enforce sectoral safety and market conduct standards. Key federal departments such as the Federal

Department of Justice and Police (FDJP), the Department of the Environment, Transport, Energy and Communications (DETEC), and the Federal Department of Foreign Affairs (FDFA) orchestrate cross-government AI strategy, regulation drafting, and foreign cooperation, particularly implementing the Council of Europe's AI Convention.

Switzerland supplements this with support structures for compliance: regulators issue detailed guidance and audit tools, while testbeds developed through initiatives like the Competence Network for Artificial Intelligence (CNAI) enable model stress testing and behavior reproduction crucial for conformity verification. These test environments support not only innovation but provide practical facilities to gather evidence fulfilling EU and Swiss regulatory expectations.

Inter-agency coordination is strong in Switzerland to handle overlapping responsibilities. Joint working groups and secondments between FDPIC, sectoral regulators, and federal departments facilitate shared risk assessments, coordinated enforcement, and unified engagement with AI providers facing multiple regulatory inquiries. This cooperation ensures Swiss firms benefit from a coherent supervisory

experience while preparing for potential parallel scrutiny from EU authorities given Switzerland's extraterritorial obligations.

For incident handling and enforcement, Swiss regulators rely largely on existing powers within traditional laws, adapting them to AI-specific risks post the anticipated amendments required by the AI Convention's ratification. FDPIC can impose data protection fines and corrective actions, while sectoral regulators maintain enforcement through permits, licenses, and product recalls. Criminal liability provisions address AI misuse such as the creation of deepfakes or algorithmic fraud.

Compliance support mechanisms emphasize a "guidance-first" approach: regulators publish AI risk-specific instructions, run sandbox programs, and provide audit toolkits to identify compliance gaps early. Swiss provider focus on transparency, contestability, and trustworthiness aligns with these priorities. Early-stage inspections involve facilitating audits, sharing reproduceable test data, and cooperation via technical laboratories.

Internationally, Switzerland actively engages in multilateral AI governance frameworks, centered

on the Council of Europe's AI Convention which it signed in March 2025 but has yet to ratify. This agreement underpins Switzerland's commitment to interoperability and mutual recognition of AI regulatory measures with EU states and beyond. Bilateral cooperation agreements and participation in international regulator networks enable Swiss authorities to share intelligence, execute joint investigations, and respond to cross-border enforcement requests. These dynamics also oblige Swiss AI providers to maintain transparent, well-indexed technical documentation and secure contractual arrangements with EU representatives and supply chain partners.

Swiss SMEs benefit from pragmatic, risk-proportionate compliance options to efficiently manage EU AI Act requirements without disproportionate burden. Using standardized templates for Data Protection Impact Assessments, model cards, and technical dossiers allows smaller companies to streamline documentation while targeting key risk areas. Early engagement with EU authorised representatives and accredited technical labs can reduce reliance on costly third-party conformity

assessments, fostering cost-effective market entry.

Overall, Swiss companies navigating EU AI Act compliance face a layered, risk-based approach incorporating strong domestic guidance, sectoral enforcement, and international cooperation. Early, thorough risk

mapping and documentation combined with strategic use of EU authorised representatives and testbeds offer a realistic, manageable pathway for Swiss AI providers to access EU markets while leveraging Switzerland's innovation-friendly, rights-preserving regulatory model.

Ecosystem & Market Readiness

Switzerland's AI ecosystem is progressively evolving into a sophisticated framework that balances innovative potential with robust oversight, mirroring aspects of the UK's model but tailored to Swiss legal, institutional, and market realities. This ecosystem supports the translation of AI research breakthroughs into deployable, trustworthy systems while addressing compliance with emerging international and European standards, notably given Switzerland's close economic ties to the EU and participation in the Council of Europe's AI Convention.

At the foundation of Switzerland's AI ecosystem are its world-class research institutions and public interest testbeds. National initiatives like the Competence Network for Artificial Intelligence (CNAI) and leading academic centers foster applied research, develop reproducible evaluation pipelines, and maintain high-value datasets and domain expertise. These capabilities underpin trustworthy AI development by enabling third-party model validation and robust conformity assessments critical for market acceptance and regulatory compliance. Complementing

academic efforts, government-backed testbeds provide trusted research environments (TREs), allowing firms and regulators to reproduce model behavior with sensitive or private data safeguarded. These testbeds are vital for assessing risks, supporting post-market monitoring, and fulfilling documented Swiss and EU regulatory requirements.

Swiss regulatory stewardship emphasizes practical guidance over prescriptive one-size-fits-all laws. Authorities including the Federal Data Protection and Information Commissioner (FDPIC), coupled with

sectoral regulators like FINMA (financial markets) and Swissmedic (medical devices), provide transparent playbooks, auditing frameworks, and sandbox opportunities tailored to Swiss legal standards and closely aligned with EU mandates. FDPIC's AI-specific guidance facilitates data protection compliance, focusing on fairness and transparency, while broader government frameworks such as the "Digital Switzerland Strategy 2025" establish secure baseline requirements for public sector procurement, digital transformations, and ethical AI use. These combined efforts reduce uncertainty among innovators and create standardized tools like model cards, Data Protection Impact Assessments (DPIAs), risk registers, and testing protocols, which assist suppliers in producing traceable evidence aligning with both Swiss and international expectations.

The commercial landscape in Switzerland includes dynamic industry clusters spanning technology hubs in Zurich, Lausanne, and Geneva, encompassing large firms, scale-ups, and SMEs. Larger entities possess the legal and technical resources to adopt structured governance and comprehensive documentation workflows necessary for regulatory

conformity. However, many SMEs face challenges such as limited access to accredited testing labs, budget restrictions for third-party assessments, and gaps in familiarity with risk-based compliance practices. Switzerland addresses these through targeted accelerator programs, incubators, and funding streams aimed at helping SMEs build scalable compliance infrastructures—developing critical assets like inventories, model cards, and test logs—in confinement with proportionality to risk levels.

Assurance and conformity are central pillars ensuring market readiness. Switzerland's evolving assurance market is built upon regulator audit frameworks, standardized toolkits, and engagement with international standards bodies. Efforts spearheaded by bodies like the Swiss Association for Standardization and technical accreditation providers aim to professionalize assurance activities by certifying auditors and calibration labs, providing consistency and trustworthiness in AI audits. This developing ecosystem supports Swiss exporters meeting EU conformity demands, where accredited auditors and laboratories serve as trusted intermediaries to verify risk management, security, performance validation, and human oversight. Concerted scaling of

assurance capacity is vital to accommodate growing exporter demands and the complexity of third-party conformity assessments.

Public-sector demand plays a catalytic role in shaping supply, trust, and compliance norms across Switzerland's AI ecosystem. Federal, cantonal, and municipal governments increasingly leverage AI procurement and pilot projects as exemplars for compliant deployments. Switzerland's AI strategy embeds contractual clauses, risk assessment templates, and security baselines that vendors must satisfy to secure public contracts, effectively operating as de facto certifications. These initiatives aggregate use cases for testing and evaluation, stimulate market readiness, and set practical benchmarks aligned with European buyers' regulatory expectations, further accelerating acceptance and adoption among private firms targeting both Swiss and EU markets.

The technical infrastructure underpinning market readiness is robust, featuring secure compute resources, TREs, and reproducibility platforms, many developed through partnerships between academia, government missions, and industry consortia. Such infrastructure ensures investigators and auditors

can rerun AI evaluations, test robustness to adversarial inputs, and verify data provenance without compromising data privacy or transferring sensitive information abroad. Access to accredited testbeds and documented test suites is especially beneficial for exporters, reducing barriers and enabling smoother, expedited third-party assessments and regulator inquiries.

Skills and talent development remain key focus areas. Switzerland fosters a diverse pipeline of AI practitioners, legal experts, and compliance professionals through doctoral programs, vocational training, and government-sponsored reskilling initiatives. Building assurance capacity entails training specialized auditors and accrediting independent testing facilities to meet growing domestic and export market demands. While Switzerland's talent pools are strong, expanding practitioner capacity and strengthening cross-disciplinary expertise are critical priorities to scale credible conformity and post-market surveillance services attuned to EU and global AI regulations.

Despite these strengths, several friction points exist that can hinder EU market access for Swiss providers. Geographic disparities in lab and assessor availability can impose

logistical and financial strains, particularly for SMEs. Small and medium enterprises often struggle with the overhead of preparing full conformity dossiers, while legal divergences between Swiss regulatory interpretations and EU prescriptive obligations introduce dual-compliance costs. Assurance standards, though progressing, are not yet uniformly adopted, which complicates interoperability. Addressing these gaps requires coordinated investments to expand testbed networks, publishing clear documentation templates for risk-proportional compliance, and strengthening dialogue between Swiss and EU assurance bodies for mutual recognition and streamlined assessments.

Practical recommendations to further advance the Swiss AI ecosystem's market readiness include: scaling accredited testbed and laboratory networks to make conformity assessments more affordable and accessible; developing sector-specific documentation templates and lean conformity toolkits to accommodate SMEs; promoting assurance standards harmonized with EU expectations to enhance interoperability; leveraging public procurement to create predictable, repeatable compliance requirements

that serve as market signals; and investing substantially in assurance training and inspector capacity to mature the AI audit market effectively. Collectively, these actions reduce the marginal costs of compliance, making Swiss AI suppliers more competitive within regulated EU and global export markets.

In conclusion, Switzerland's AI ecosystem combines deep research excellence, regulator-led practical guidance, emerging assurance capabilities, and active public-sector demand to form a credible, operational pathway from innovation to compliant AI deployment. Testbeds, playbooks, auditor accreditation, and procurement frameworks provide a strong foundation transforming abstract legal obligations into manageable business practices. The pace at which Swiss firms can translate their technological strengths into trusted, exportable products hinges on expanding conformity infrastructure, enhancing SME-focused compliance clarity, and aligning assurance standards with the broader EU regulatory landscape.

Figure 2: Key components of UK AI Ecosystem

Key Insights & Recommendations

Switzerland is advancing its AI ecosystem with a pragmatic, coordinated strategy that leverages its world-class research, sectoral regulators, and growing assurance capabilities. This system translates technological AI capabilities into market-ready, trustworthy products that can compete effectively in regulated markets like the EU. Drawing from the Swiss regulatory landscape and its alignment with international norms, the following strategic takeaways and recommendations provide a roadmap for government, regulators, and industry actors focused on scaling assurance capacity, easing SME compliance burdens, enhancing testbed infrastructure, and fostering cross-border interoperability.

Overview: Strategic Focus for Competitive AI Ecosystem

Switzerland's AI ecosystem benefits from a solid foundation of research institutions, regulatory guidance, and sector-specific enforcement. Rather than relying on a single horizontal AI law, Swiss authorities prioritize guidance, practical audit frameworks, and voluntary compliance measures tailored to risk and sector. This approach fosters innovation while meeting stringent

oversight demands domestically and for EU market access. Operational readiness requires converting high-level AI strategies into enforceable evidence, reducing compliance friction, and accelerating exports.

Key Insight 1: Prioritize Technical and Assurance Capacity

The most significant enabler of supervision and export readiness is investing in accredited testing laboratories, reproducible testbeds, secure data environments, and

auditor training. These capacities make it possible to transform guidance into demonstrable compliance evidence, reducing assessment delays and costs. Given the Swiss economy's concentration in health, finance, and mobility, the Federal Council, in collaboration with DETEC and EAER, should accelerate funding and accreditation initiatives to build an interoperable testbed and lab network focused on these high-priority sectors.

Key Insight 2: Implement a “Compliance-by-Design” Playbook

Swiss providers can mitigate regulatory friction by embedding EU-aligned governance and documentation practices from AI product inception. This involves maintaining risk registers, versioned datasets, model cards, Data Protection Impact Assessments (DPIAs), incident logs, and streamlined Quality Management Systems (QMS). The Federal Council and regulators should publish an industry-tailored compliance starter pack specifically for SMEs and sector use cases. Concentrating these resources on a centralized government portal and integrating them into national accelerator programs will facilitate SME uptake.

Key Insight 3: Make Authorised Representation Practical and Cost-Effective

Swiss third-country providers marketing AI in the EU must appoint authorised representatives within the EU to meet compliance and liaison obligations. This requirement often poses challenges, especially for SMEs unfamiliar with the process and associated costs. Supporting market formation for authorised representative services via a light-touch accreditation scheme, standardized engagement contracts, and a public registry of vetted providers will lower legal and search costs, promoting broader compliance.

Key Insight 4: Leverage Public Procurement as a Compliance Catalyst

Government procurement and pilots serve as powerful levers to model compliant AI adoption and create early markets that require traceable conformity evidence. Switzerland's "Digital Switzerland Strategy 2025" should enhance central procurement playbooks to mandate EU-aligned documentation—model cards, audit reports, and test protocols—in AI-related tenders. Publishing exemplar contract clauses and compliance templates will further standardize supplier requirements and

incentivize internalization of EU expectations.

Key Insight 5: Develop Proportionate Assurance Market for SMEs

A mature assurance market must balance the needs of both high-risk and lower-risk AI providers. Switzerland should introduce voucher schemes and funding to enable SMEs to access accredited labs and auditors without prohibitive cost barriers. Publishing a two-tiered assurance framework differentiated by risk—permitting self-assessment or lightweight audits for low/medium-risk systems versus full third-party evaluation for high-risk AI—will align compliance efforts with actual exposure while fostering market participation.

Key Insight 6: Harmonize Documentation Standards Across Regulators

Differing documentation templates and regulatory expectations across Swiss authorities increase compliance complexity. The Federal Council led by DETEC, in coordination with FDPIC, FINMA, Swissmedic, and other sectoral regulators, should convene working groups to harmonize a minimum evidence standard for AI systems. This standard should specify essential dossier components, logging

practices, and performance metrics designed to be fully compatible with EU conformity demands.

Key Insight 7: Expand the Role of Trusted Research Environments (TREs) and Testbeds

TREs and secure testbeds are critical to allow companies to demonstrate AI performance on sensitive data without exposing raw datasets externally. Swiss authorities should expand TRE capacity and subsidize access for conformity assessments. Building regulator-friendly test suites that anticipate EU audit scenarios ensures readiness and facilitates smooth compliance verification.

Key Insight 8: Strengthen Formal International Regulatory Cooperation

Fast, practical evidence-sharing depends on effective bilateral and multilateral agreements. Switzerland should prioritize negotiating memoranda of understanding (MOUs) with key EU authorities and take an active role in regulatory cooperation forums to establish time-limited evidence requests, standardized technical artifact formats, and protocols for joint investigations. This formal cooperation improves enforcement agility and reduces duplication.

Key Insight 9: Integrate Reskilling and Assurance Training in Talent Development

Auditing, investigation, and compliance expertise are bottlenecks for scaling credible oversight. Swiss federal departments and training institutions should fund short, practice-focused certification programs for AI auditors and regulatory investigators. Introducing fast-track placements with testing laboratories and regulatory bodies can accelerate on-the-job experience and build a critical mass of skilled professionals.

Key Insight 10: Implement Measurable KPIs and Annual Readiness Reporting

Tracking progress through clearly defined KPIs supports evidence-based policy tuning and resource allocation. Switzerland should publish an annual "AI compliance readiness scorecard" including indicators such as: number and geographic spread of accredited labs; average duration and costs of conformity assessments; uptake of SME vouchers; successful cross-border evidence exchanges; and sectoral preparedness rankings. These metrics will guide targeted funding and regulatory simplification efforts.

Targeted Recommendations for Policymakers

Launch a 24-month Assurance Scale-Up program to fund lab accreditation, TRE expansion, and SME testing vouchers.

Mandate regulator harmonization efforts to define unified data and documentation standards compatible with EU requirements.

Promote a public, vetted registry of authorised representatives to encourage competition and limit SME compliance costs.

Use public procurement as a rapid standardization vehicle requiring EU-aligned evidence bundles.

Formalize MOUs with EU regulators to expedite cross-border investigation cooperation and evidence sharing.

Targeted Recommendations for Industry and Exporters

Adopt an "EU-ready minimum" documentation toolkit encompassing model cards, DPIAs, dataset versioning, performance metrics, and incident protocols.

Appoint an EU authorised representative early and clarify compliance responsibilities across contractual chains.

Utilize Swiss testbeds and accredited labs to create reproducible evidence packages pre-market, maintaining searchable technical registries.

SMEs should prioritize compliance for key products, leveraging vouchers and shared lab resources to reduce costs.

Implement aligned incident response and post-market surveillance processes that satisfy both Swiss and EU regulators.

Immediate Checklist (30/60/90 days)

- 30 days: Map product portfolio to EU AI risk categories; select candidate EU authorised representative; initiate DPIA drafting.
- 60 days: Compile minimum technical dossier for primary product; engage lab/testbed for baseline reproducibility validation.

- 90 days: Finalize evidence package; update procurement and marketing materials with compliance claims; register authorised representative.

Closing Note: From Friction to Competitive Advantage

Switzerland's strengths—including outstanding research institutions, expanding testbed infrastructure, and regulator collaboration—constitute the core ingredients for an agile, market-friendly AI compliance ecosystem. By intensifying assurance capacity building, simplifying SME pathways, and formalizing cross-border cooperation with EU authorities, Switzerland can turn regulatory complexity into a distinct commercial advantage. The result will be Swiss AI products that are not only legally compliant but also demonstrably trustworthy and competitive in demanding international markets.

30 days: map product portfolio to EU risk categories

60 days: compile minimal technical dossier

90 days: complete an evidence package

Switzerland does not yet have a single, horizontal AI Act; instead, it is pursuing a sector-specific, technology-neutral approach anchored in existing laws and the forthcoming implementation of the Council of Europe AI Convention. Below are thirty references, formatted as requested, that track Switzerland's AI regulation status and related policy context.
