Strengthening Poland's AI Talent Attractiveness: Strategic Imperatives to Reverse Early Gains in AI-Skills Migration and Build a Competitive Human-Capital Base for 2025 and Beyond

Between-country AI skills migration (November 2025)

Explanation: This chart displays the net migration flows of LinkedIn members with AI skills from 2019 to 2024.

Between 2019 and 2024, Poland's net migration of LinkedIn members with AI skills shows a modest positive trend overall, but one marked by volatility and an emerging slowdown. Starting from a slightly negative position in 2019 (-0.10 per 10 000 LinkedIn members), Poland transitioned into positive inflows by 2020 and 2021, before reaching a peak of **1.64 in 2022**—a level signalling growing attractiveness for AI-skilled professionals. This period coincides with increased national focus on digitalisation, early groundwork for AI governance, and growing domestic demand for data-driven capabilities across finance, e-commerce, and public services.

However, after 2022, Poland's net inflows began to decline, dropping to **1.12 in 2023** and **0.95 in 2024**. While still positive, this deceleration suggests Poland is struggling to sustain the momentum needed to compete with higher-earning OECD markets for global AI talent. The contrast with peers such as Luxembourg or Switzerland—countries consistently attracting high volumes of AI professionals—highlights Poland's structural disadvantages: lower wage premiums, limited scale of advanced AI R&D environments, and relatively young institutional frameworks for AI funding and governance.

The 2022 high point likely reflects increased labour mobility after COVID-19 restrictions eased and the expansion of remote-friendly recruitment. Yet the subsequent decline suggests tightening competition and persistent challenges in converting Poland's emerging digital ecosystem into a durable AI-skills magnet. Moreover, other Central and Eastern European economies—such as Lithuania, Latvia, and Czechia—showed sharper post-2022 drops, hinting at a regional effect of talent outflow towards Western Europe rather than intra-regional rebalancing.

Several structural dynamics explain Poland's trajectory:

- **Limited advanced AI research density** constrains opportunities for senior specialists seeking cutting-edge environments.
- **High emigration pull factors**, including stronger salaries and mature AI industries abroad, continue to draw experienced Polish professionals outward even as inflows improve.
- **Fragmented private-sector AI adoption**, concentrated in select sectors (IT services, finance, telecom), limits the breadth of talent demand and reduces long-term retention.

- **Late-stage institutionalisation of AI policy**, with clearer governance and funding frameworks only emerging after 2022, may have dampened earlier inflow momentum.

Nevertheless, the data also suggest a clear inflection point. Poland has crossed from negative or near-zero net inflows into a consistently positive range (2020–2024), indicating rising recognition of Poland as a viable location for AI careers. To convert this into sustained competitive advantage, Poland should:

1. **Scale applied AI research environments:** Expand national AI labs, computing infrastructure and public–private R&D programmes to create advanced work environments that attract and retain top-tier specialists.
2. **Deepen private-sector uptake:** Support AI adoption in manufacturing, healthcare, and energy to broaden the labour market’s demand profile and create long-term career pathways for AI professionals.
3. **Strengthen immigration and retention incentives:** Streamline visas for high-skill tech workers, expand relocation support, and improve wage competitiveness through targeted tax incentives.
4. **Invest in human-capital progression:** Increase postgraduate AI training capacity, develop reskilling paths for engineers and data professionals, and create incentives that keep Polish graduates in the domestic workforce.
5. **Monitor and publish AI talent indicators:** Annual public reporting of AI-skills migration, wage benchmarks, and sectoral demand can guide policymaking and demonstrate commitment to a data-driven talent strategy.

In sum, while Poland shows encouraging movement toward attracting AI-skilled workers, the post-2022 slowdown signals the need for strategic action. Building a stronger research base, scaling industrial demand, and enhancing talent retention will be essential to secure Poland’s position as a competitive AI-skills destination in the OECD landscape.

AI & Partners

Who Are We

AI That You Can Trust

Why Us?

Stay on the right side of history. At AI & Partners, we believe AI should unlock potential—not cause harm. We've seen the fear and fallout when teams lose control of AI, but also the trust and innovation that follow when it's handled responsibly. That's why we exist: to help you build AI you can trust and stand behind—for the long run.

80%

of AI systems
are unknown

What Do We Do?

We enable safe AI usage—for your organization and your clients. Unknown AI adoption leads to confusion, risk, and reputational damage. We help you take control with tools to identify, monitor, and govern all AI systems—so you're not reacting to AI, you're leading it.

How Do We Do It?

Do you know what AI systems you have? Identify all known and unknown AI systems (algorithms, LLMs, prompts, and models) from all internal and external AI vendors, automated by generating your inventory. Overall, 80% of AI inventory is unknown to our clients.

How do you guarantee ongoing safe AI use? Continuously monitor deployed AI systems for performance drift, anomalies or failures, real-world impacts, and emerging risks (e.g. data poisoning). Any malfunction of an AI system has severe implications for organisations (e.g. inability to assess online misinformation that leads to widespread public mistrust), so monitoring becomes a matter of urgency.

AI Discovery & AI Inventory

Automatically detect all AI systems, including models, algorithms, and prompts, and maintain a live, always-updated register for full visibility and compliance.

Responsible AI

Embed fairness, transparency, and control into every stage of AI use—aligning with the EU AI Act and building 'Trustworthy-by-Design'.

Model Monitoring

Continuously track your AI models after deployment to detect drift, bias, or failure—so you stay in control and prevent harm before it happens.

Contents

This section outlines the structure of the report, detailing chapters on the Polish AI policy landscape, regulatory initiatives, governance mechanisms, findings, and recommendations. It serves as a navigation guide, enabling readers to quickly locate specific analyses, datasets, and policy discussions relevant to Poland's evolving artificial intelligence ecosystem.

Overview

Artificial Intelligence (AI) is reshaping economies and governance worldwide, and Poland is establishing itself as a proactive advocate of ethical and human-centric AI within the European Union.

Anchored in the EU's evolving regulatory landscape, Poland has adopted an alignment-driven approach that emphasizes ethical implementation and the development of administrative competence. Rather than introducing standalone AI legislation, Poland is leveraging strategic frameworks, such as the updated 'AI Development Policy in Poland', and soft-law instruments to promote trustworthy AI development. At the heart of Poland's evolving AI governance strategy is the ongoing process of adapting national regulations to the EU AI Act. Work is underway on national regulations regarding the notification of high-risk systems, the competence of supervisory bodies, and the designation of conformity assessment bodies. The Ministry of Digital Affairs and the Office for Personal Data Protection are also developing guidelines for the private and public sectors. A distinctive feature of Poland's approach is its advocacy for the use of regulatory sandboxes, as outlined in the updated draft law on AI systems from February 2025, which allow for responsible AI deployment and provide a learning environment for piloting high-risk AI systems. These are complemented by strategic resources such as the 'AI Development Policy in Poland' (updated in 2024), which articulates a vision for safe, inclusive, and rights-aligned AI.

Poland's governance model is underpinned by a robust and multi-actor institutional architecture. The Polish Data Protection Authority (UODO) plays a central role in supervising the processing of personal data and has intervened in cases of decisions made by AI, issuing guidelines regarding profiling. GovTech Polska initiatives promoting the use of AI in administration are on the rise. These efforts reflect a whole-of-society approach to embedding AI governance within national goals such as public sector modernization and increasing economic competitiveness.

Poland also shows strong commitment to international standards. The country actively participated in the work on the AI Act regulation and participates in the work of the Global Partnership on AI and in the structures of the OECD AI Policy Observatory. Through these channels, Poland ensures its domestic practices remain interoperable and globally relevant, reinforcing its image as a constructive contributor to human-centric AI governance.

Aligned with the 'Policy for the Development of Artificial Intelligence in Poland from 2020' (as per the attached document), the country is targeting key sectors—including finance, industry, logistics, medicine, and e-commerce—for AI-enabled transformation. The National Centre for Research and Development (NCBR) plays a key role in funding AI-related R&D projects. The 'AI Development Policy' also emphasizes the development of administrative competence and ethical implementation, helping build a skilled, future-ready workforce.

Poland's data and infrastructure capabilities also reinforce its AI readiness. Companies are increasingly treating data as a key asset, using it to train models, automate, personalize, and optimize processes. Data lakes, data warehouses, and Machine Learning Operations (MLOps) platforms are gaining popularity, enabling integration and effective model training. Practices like data augmentation, synthetic data, anonymisation/pseudonymisation, and federated learning are also being implemented. These efforts, coupled with robust broadband penetration and an expanding open-data culture, create favorable conditions for large-scale, data-driven AI projects across the economy.

Through this combination of EU-aligned oversight, innovation-driven approaches, and globally harmonized ethics frameworks, Poland is building a comprehensive, adaptive model of AI governance. By prioritizing human rights, transparency, and practical application, Poland is charting a pragmatic course toward AI that is both innovative and democratically grounded.

Specific AI Governance or Law

The Polish government introduced a draft law to integrate the European Union's Artificial Intelligence Act (Regulation 2024/1689) into national legislation in October 2024. The draft act aims to implement the EU AI Act by establishing a monitoring committee and a social council for diverse input, promoting safe AI use, ensuring transparency, and providing best practice recommendations for ethical implementation.

Specific AI Governance in Poland

Rather than adopting sweeping standalone legislation, Poland is preparing to adapt its national legal system directly to the EU AI Act. Although the AI Act was adopted at EU level, work is underway on national regulations regarding the notification of high-risk systems, the competence of supervisory bodies, and the designation of conformity assessment bodies. In addition, the Ministry of Digital Affairs and the Office for Personal Data Protection are developing guidelines for the private and public sectors.

Instead of designating an existing agency, Poland plans to establish a dedicated supervisory authority – Artificial Intelligence Development and Security Commission (KRiBSI). This commission is intended to be a specialized, expert body with the potential to guide both businesses and citizens in the era of AI. It will not focus solely on control and penalties, but it will support innovation, education, and regulatory compliance. Despite its ambitious goals, the parliamentary resolution is still in draft (updated version based on feedback from

the second iteration of review dated 23 June 2025), which may result in a delay, risking its full operational readiness as required by the EU AI Act.

To foster innovation while preparing for compliance, the Ministry of Digital Affairs published an updated draft law on AI systems in February 2025 (Act on Artificial Intelligence Systems), which provides for regulatory sandboxes to support AI innovation. Moreover, this draft includes an extraordinary sanction mitigation mechanism, which aims to allow businesses to correct violations promptly. This draft is currently undergoing another round of consultation. Upon entering into force, this law will have a significant impact on the IT landscape in Poland.

Poland is also building long-term supervisory capacity. In 2024, the 'AI Development Policy in Poland' was updated, emphasizing the development of administrative competence and ethical implementation. GovTech Polska initiatives promoting the use of AI in administration (e.g., analysis of tender data, fraud prediction, traffic management) are on the rise. Complementing these instruments is the Polish government's emphasis on a “human-centred approach” to AI, which means that respect for public values based on human rights is the starting point behind the purpose, design and use of AI. AI should reinforce public values and human rights rather than weaken them.

AI Ethics Guidelines and Sectoral Governance Tools

In the absence of AI-specific national legislation, Poland uses a layered model rooted in the EU AI Act and reinforced by existing domestic rules on data protection, cybersecurity, consumer protection, labor law and product safety. Key policy frameworks include: An updated 'AI Development Policy in Poland' from 2024 emphasizes the importance of AI as a pillar of the state's and economy's digital transformation. The Expert Opinion on the update of the AI Policy in Poland from 2024 also highlights this. Active guidance from the Polish Data Protection Authority (UODO), which supervises the processing of personal data to ensure compliance with relevant laws. In 2024, the UODO intervened in cases of decisions made by AI and issued guidelines regarding profiling. More cases are going to court, including those based on Article 22 of the GDPR (unexplained automated decisions) and concerning AI liability in the insurance sector.

Poland also aligns with international soft-law standards by participating in the work of the Global Partnership on AI and in the structures of the OECD AI Policy

Observatory. The country actively participated in the work on the AI Act regulation.

Proposed AI Regulatory Authority and Future Outlook

Work is underway on national regulations regarding the competence of supervisory bodies and the designation of conformity assessment bodies, essential for the implementation of the EU AI Act. The Ministry of Digital Affairs and the Office for Personal Data Protection are developing guidelines for the private and public sectors.

Results from regulatory sandboxes and ongoing research will feed directly into secondary legislation and technical guidelines, ensuring Poland's domestic framework evolves in lock-step with both EU requirements and local socio-economic needs.

Taken together, Poland's structured, EU-coordinated approach aims to unlock AI's economic and social value while safeguarding fundamental rights and public trust—anchoring the country's role as a responsible AI innovator within the European Union.

Polish National AI Strategy

Poland's AI governance approach is grounded in a value-driven, EU-aligned framework that combines ethical safeguards, public sector leadership, and technological innovation to promote responsible AI deployment. Through instruments like the 'Policy for the Development of Artificial Intelligence in Poland from 2020' (updated in 2024) and emerging regulatory mechanisms such as proposed regulatory sandboxes, Poland fosters context-sensitive, and trustworthy AI adoption.

Poland's AI governance model is built on foundational principles including human-centricity, fairness, transparency, and respect for individual and collective rights—values strongly aligned with EU and OECD guidelines. While the EU AI Act provides the overarching legislative framework, Poland's approach complements this through its 'Policy for the Development of Artificial Intelligence in Poland from 2020', a comprehensive document that defines ethical, regulatory, and innovation pathways for AI development. Unlike Singapore's voluntary, sector-led frameworks, Poland leans on coordinated public governance and alignment with EU mandates, promoting national cohesion and international interoperability. A defining trait of Poland's model is its emphasis on ethical implementation and the development of administrative competence. The 'AI

Development Policy in Poland' updated in 2024, highlights AI's importance as a pillar of the state's and economy's digital transformation. The government champions public trust by operationalizing these values through the Ministry of Digital Affairs and the Office for Personal Data Protection, which are developing guidelines for the private and public sectors. The Polish Data Protection Authority (UODO) also plays a key role in enforcement. Poland also adopts a context-aware and risk-sensitive stance. The strategy prioritizes sectoral adaptation, supporting AI deployment in areas like finance, industry, logistics, medicine, and e-commerce—balancing innovation with proportional governance. The updated draft law on AI systems from February 2025 provides for regulatory sandboxes, offering a controlled environment for piloting high-risk AI systems and providing a regulatory learning space.

The 'Policy for the Development of Artificial Intelligence in Poland from 2020' advocates for embedding AI governance into both corporate operations and public administration. Responsibility for ethical deployment is distributed across developers, public institutions, and civil society, aligning with Singapore's cooperative governance model while maintaining state-led coordination. GovTech Polska initiatives promoting the use of AI in administration are on the rise. Capacity building and inclusion are also central to Poland's framework. The 'AI Development Policy' emphasizes the development of administrative competence and ethical implementation, which implies a focus on skills development and talent cultivation. These social objectives parallel Singapore's skills and inclusivity programmes, though Poland emphasizes welfare-state reinforcement and democratic cohesion as core governance imperatives. Finally, Poland's approach is not static. The policy documents highlight ongoing work on national regulations to adapt to the EU AI Act and the continuous development of guidelines. This mirrors Singapore's agile governance model, though Poland's use of national institutions to guide such evolution underscores a more structured and institutionalized path toward AI maturity.

Approach to AI Regulation

Poland has positioned itself as a proactive participant in shaping AI governance within the European Union, adapting its legal system and fostering responsible AI development through strategic initiatives and ethical principles aimed at building a robust, human-centric AI ecosystem.

1. Regulatory and Strategic Frameworks

Poland's approach to AI governance is rooted in alignment with EU initiatives, particularly the EU AI Act, rather than standalone national legislation. Although Poland has not introduced binding national AI regulations, it has laid down a strategic foundation through non-binding instruments such as the 'AI Development Policy in Poland', updated in 2024. These frameworks embed ethical and social values into AI development, emphasizing administrative competence and ethical implementation. Additionally, the Ministry of Digital Affairs published an updated draft law on AI systems in February 2025, which provides for regulatory sandboxes to support AI innovation, aligned with the EU AI Act. This regulatory innovation supports compliance testing and iterative learning, enabling organizations to adapt to EU requirements efficiently.

2. Institutional Support and Strategic Missions

Institutional leadership is shared by various ministries and bodies. The Ministry of Digital Affairs and the Office for Personal Data Protection are developing guidelines for the private and public sectors. The Polish Data Protection Authority (UODO) has intervened in cases of decisions made by AI and issued guidelines regarding profiling in 2024. GovTech Polska initiatives promoting the use of AI in administration (e.g., analysis of tender data, fraud prediction, traffic management) are on the rise.

3. Standards Development and Global Engagement

Poland is actively engaged in international AI standard-setting and ethics debates. It actively participated in the work on the AI Act regulation and participates in the work of the Global Partnership on AI and in the structures of the OECD AI Policy Observatory. By contributing to EU policy formulation and regulatory experimentation, Poland positions itself as a bridge between domestic innovation and supranational coherence in AI governance.

4. Sectoral and Extended Regulatory Approaches

Poland does not mandate sector-specific AI laws but anticipates sectoral implementation to evolve under the umbrella of the EU AI Act. The proposed regulatory sandboxes would allow high-risk AI deployments in real-world settings, promoting sector-specific insights and risk-mitigation practices. The 'AI Development Policy in Poland' targets key sectors—including finance, industry, logistics, medicine, and e-commerce—for AI-enabled transformation. Poland's broader legal landscape—including data protection, labor law, competition law, and digital commerce—is already impacting AI indirectly, setting legal guardrails around AI applications. For instance, the Office of Competition and Consumer Protection (UOKiK) is interested in big data, drawing attention to potential abuses in customer profiling, offer targeting, and favoring own services by platform operators.

5. Fostering Innovation and Indigenous Development

Innovation is central to Poland's AI agenda, driven by policies that aim to nurture domestic AI capabilities and ensure economic competitiveness. The proposed regulatory sandboxes provide an environment for Polish enterprises to develop, test, and iterate AI solutions in compliance with EU norms.

Public-private partnerships and the promotion of AI ethics in development signal Poland's commitment to fostering a responsible and competitive AI ecosystem. The Polish government announced a plan in November 2024 to invest 1 billion zlotys (around 240 million dollars) in AI development to increase economic competitiveness and strengthen the defense sector. The National Centre for Research and Development (NCBR) plays a key role in funding AI-related R&D projects.

6. AI in Public Sector Transformation

While Poland's AI governance is still evolving, the state has begun integrating AI into digital public services and public sector innovation through GovTech Polska initiatives.

7. AI Skills, Education and Inclusion

Poland's 'AI Development Policy' emphasizes the importance of increasing economic competitiveness and strengthening the defense sector through AI development, which inherently requires skilled personnel. This implies an emphasis on inclusive education, research support, and talent development as pillars of responsible AI adoption.

8. Infrastructure, Compute and Data Foundations

Though still emerging, Poland is gradually building the data and infrastructure foundations necessary for scalable AI deployment. Companies are increasingly treating data as a key asset, using it to train models, automate, personalize, and optimize processes. Data lakes, data warehouses, and Machine Learning Operations (MLOps) platforms are gaining popularity, enabling integration and effective model training. Practices like data augmentation, synthetic data, anonymisation/pseudonymisation, and federated learning are also being implemented. More companies are appointing Chief Data Officers and creating data governance teams responsible for data quality. Poland is experiencing dynamic growth in AI and big data start-ups and companies. Strong R&D centers exist, developing technologies like natural language processing and image processing.

Approach to Foster Innovation

Poland's comprehensive approach to AI governance, deployment and innovation mirrors its EU peers and is channeled through the 'Policy for the Development of Artificial Intelligence in Poland from 2020' (further updated in 2024). The strategy treats AI as a driver of social well-being, competitiveness, and public-sector modernization while anchoring every initiative in human-centric, trustworthy AI design.

1. Unlocking economic value through targeted AI deployment

The 'Policy for the Development of Artificial Intelligence in Poland from 2020' (as per the attached document) identifies key sectors for AI-enabled transformation. These include finance, industry, logistics, medicine, and e-commerce. The government's plan to invest 1 billion PLN (around 240 million US Dollars) in AI development further signals a deliberate tilt toward sectors that can increase economic competitiveness and strengthen the defence sector.

2. Catalysing innovation through strategic clustering and ecosystems

The National Centre for Research and Development (NCBR) plays a key role in funding AI-related R&D projects, fostering collaboration between research centers and industry. Poland is experiencing dynamic growth in AI and big data start-ups and companies, indicating a developing ecosystem.

3. Enabling trusted and responsible data use

Poland's strategy foregrounds data protection and ethical use. The Polish Data Protection Authority (UODO) supervises the processing of personal data to ensure compliance with the GDPR. Companies are increasingly treating data as a key asset, implementing practices like data augmentation, synthetic data, anonymisation/pseudonymisation, and federated learning. More companies are appointing Chief Data Officers and creating data governance teams responsible for data quality.

4. Scaling AI in the public sector

GovTech Polska initiatives are promoting the use of AI in administration, with projects focusing on areas like analysis of tender data, fraud prediction, and traffic management. These initiatives aim to improve public services and efficiency through AI.

5. Advancing computing and research infrastructure

Poland participates in EU super-computing and data-space initiatives, though specific national supercomputing infrastructure details are not provided in the attached document. However, the mention of strong R&D centers developing technologies like natural language processing and image processing indicates a focus on research infrastructure.

6. Empowering SMEs and start-ups

The updated draft law on AI systems from February 2025 provides for regulatory sandboxes to support AI innovation, which can lower the entry barrier for SMEs and startups. The dynamic growth in AI and big data start-ups also showcases a supportive environment.

7. Developing a future-ready workforce

The 'AI Development Policy in Poland' emphasizes the development of administrative competence and ethical implementation, implying a focus on skills development. The government's investment plan for AI development also suggests a need to cultivate more talent in the field.

8. Aligning AI innovation with sustainability goals

While the attached document doesn't explicitly detail AI's role in sustainability goals, the overall 'AI Development Policy' and Poland's alignment with EU strategies suggest an implicit connection, as EU initiatives often link digital transformation with green objectives.

9. Building public trust and ethical AI

The 'AI Development Policy' emphasizes ethical implementation and a "human-centred approach" to AI. The Ministry of Digital Affairs and the Office for Personal Data Protection are developing guidelines for the private and public sectors, which would likely include ethical considerations. The provision for regulatory sandboxes also allows for validation of compliance under real-world conditions.

10. Shaping global AI governance and standards

Poland actively participated in the work on the EU AI Act and participates in the work of the Global Partnership on AI and in the structures of the OECD AI Policy Observatory. This demonstrates Poland's commitment to shaping international AI governance and contributing to interoperable, human-centric standards worldwide.

11. Polish LLM for the public and private sectors

Poland is actively developing its own open-access LLM – PLLuM (Polish Large Language Model) – which is specifically adapted to the Polish language. It facilitates a deeper understanding of Polish expressions and idioms, and is designed to support both the public and private sectors.

Digital Decade

2025: Report

In Poland's draft State Digitalisation Strategy (Strategia Cyfryzacji Państwa), artificial intelligence is identified as the leading breakthrough technology critical for the country's long-term development. The strategy projects that by 2035, half of all Polish enterprises will be utilising AI—a striking contrast to both the current adoption rate of 5.9% in 2024 and the official national goal of 10% by 2030.

Achieving such a transformative shift will necessitate overcoming several structural and cultural challenges. These include limited research and innovation investment, particularly by SMEs, and a low level of awareness among entrepreneurs regarding the potential benefits of AI. According to the report Time of Necessary Changes (Czas koniecznych zmian), only 15% of Polish business executives view AI as a growth enabler—significantly lower than the global average of 33%.

Similarly, the report How do Polish companies implement AI? (Jak polskie firmy wdrażają AI?) reveals that 40% of employees in medium and large enterprises are wary of AI technologies.

A lack of specialised knowledge, skilled professionals, and access to computing resources continues to slow AI development in Poland. The draft strategy highlights the country's low ranking in computer science graduates among EU

countries and underlines the importance of developing a cohesive legal and regulatory framework. This includes updating national laws and ensuring alignment with EU-level legislation such as the AI Act, to provide a consistent and enabling environment for AI deployment. Although the draft strategy does not outline specific new initiatives, the Ministry of Digital Affairs announced in February 2025 its intention to revise the 2020 Policy for AI Development in Poland, aiming to reflect evolving technologies and emerging challenges more effectively.

Despite challenges, Poland emerged as an unexpected leader in the use of Generative AI, with 63 percent of respondents actively utilizing GenAI, both privately and professionally, surpassing the USA (41%), Great Britain (48%), and Spain (40%) (for more information, see the Generative AI Adoption: The Report, prepared by Human+AI Institute and CampusAI).

One of the concrete developments so far is the signing of a letter of intent by public institutions responsible for distributing AI development funds.

In November 2024, these entities also committed to forming the Council of Artificial Intelligence Funds, which is scheduled to be established by June 2025. The Council's roles will include advising on AI policy and funding strategies, supporting research and safe AI deployment, coordinating financing, and monitoring the AI market in Poland.

Poland is also set to benefit from European-level initiatives. The country joined one of the seven consortia selected in December 2024 by the European High Performance Computing Joint Undertaking (EuroHPC) to host an AI Factory. As part of this effort, the Poznań Supercomputing and Networking Centre (PCSS) received EUR 50 million in March 2025 to establish the PIAST AI Factory (with additional EUR 79.7 million from the Polish government), further advancing Poland's computational and innovation capabilities. The PIAST AI Factory primarily focuses on IT, cybersecurity, health & life sciences, public sector, robotics, space, and sustainability (including energy and agriculture).

In June 2025, Poland, as a leader of a consortium including Lithuania, Latvia, and Estonia, submitted an application for the construction of the Baltic AI Gigafactory. With an estimated budget of EUR 3 billion, it is the largest investment in AI in Central and Eastern Europe. This project aims to create an open and accessible AI infrastructure that will enable the development of advanced AI models. The

current plan involves expanding to 30,000 GPUs, which will enable the training of AI models with parameters measured in trillions.

Gaia AI Factory was selected by the European High Performance Computing Joint Undertaking (EuroHPC JU) in October 2025. The €70 million project is equally co-financed by the European Commission and Poland. The backbone of Gaia AI Factory is a next-generation supercomputer optimized for AI workloads, featuring over 1,000 GPU accelerators specifically designed for training and deploying large-scale AI models. Gaia AI Factory concentrates on three key domains:

***Healthcare:** Advanced medical diagnostics, personalized computational medicine, analysis of medical data, and clinical decision support systems.*

***Space Technologies:** Satellite data analysis for climate monitoring, air quality assessment, and natural phenomena observation.*

***Large Language Models (LLMs):** Development of multilingual models, including those trained on Polish-language data, to support public services and administration.*

Gaia AI Factory and PIAST AI Factory create an initiative that aligns with the EU's Digital Europe Programme, Horizon Europe, and the AI Continent Action Plan, supporting Europe's ambition to develop trusted, competitive, and sovereign artificial intelligence while maintaining transparency, accountability, and data protection standards.

Regarding the 2024 recommendation on AI, cloud, and data analytics, Poland was encouraged to (i) re-evaluate its existing support measures for advanced digital technology adoption—particularly in AI and data analytics—and (ii) facilitate widespread uptake of the next-generation cloud services developed under IPCEI-CIS, including by designing a national dissemination strategy and participating in EU-led dissemination efforts. While Poland has continued implementing existing measures, no new initiatives were introduced in 2024. The government has expressed plans to revise its roadmap, but has not yet submitted updated documentation or formally notified the European Commission of additional actions—apart from the ongoing efforts to establish the Council of AI Funds and measures already set out in the current strategy.

Government AI Readiness

Western Europe ranks as the highest-performing region in this year's Government AI Readiness Index, with five countries in the global top 10. France leads the regional ranking with a score of 79.36, narrowly ahead of the United Kingdom (78.88), followed closely by the Netherlands (77.23), Germany (76.90), and Finland (76.48). With an average regional score of 69.56, Western Europe outperforms the global average (47.59) across all three pillars of Government, Technology, and Data & Infrastructure. The region's standout strength is the Data & Infrastructure pillar, where it averages 81.91, more than 21 points above the global benchmark (59.62), reflecting its advanced digital infrastructure and high-quality data environment.

2024 Scores by Dimension

Government

Poland posts a Government-pillar score of 76.53, reflecting an active institutional push to operationalize the EU AI Act and embed trustworthy-AI principles across the public sector. Work is underway on national regulations regarding the notification of high-risk systems, the competence of supervisory bodies, and the designation of conformity assessment bodies. The Ministry of Digital Affairs and the Office for Personal Data Protection are developing guidelines for the private and public sectors. In 2024, the 'AI Development Policy in Poland' was updated, emphasizing the development of administrative competence and ethical implementation. GovTech Polska initiatives promoting the use of AI in administration (e.g., analysis of tender data, fraud prediction, traffic management) are on the rise.

Technology Sector

A Technology-pillar score of 45.41 signals a maturing yet uneven innovation ecosystem. Poland is experiencing dynamic growth in AI and big data start-ups and companies, and strong R&D centers exist, developing technologies like natural language processing and image processing. The Ministry of Digital Affairs published an updated draft law on AI systems in February 2025, which provides for regulatory sandboxes to support AI innovation. However, scaling hurdles may remain around venture funding, talent retention, and technology transfer from labs to industry. Continued support for these initiatives and cluster-based collaboration will be critical to narrow the gap with higher-scoring Western-European peers.

Data & Infrastructure Sector

With a score of 80.59, Poland exhibits strong digital foundations and a forward-looking data-governance agenda. Companies are increasingly treating data as a key asset, using it to train models, automate, personalize, and optimize processes. Data lakes, data warehouses, and Machine Learning Operations (MLOps) platforms are gaining popularity, enabling integration and effective model training. Practices like data augmentation, synthetic data, anonymisation/pseudonymisation, and federated learning are also being implemented. More companies are appointing Chief Data Officers and creating data governance teams responsible for data quality. These initiatives, coupled with robust broadband penetration and an expanding open-data culture, create favorable conditions for large-scale, data-driven AI projects across the economy.

Conclusion

Poland's artificial intelligence ecosystem is navigating a pivotal transformation—anchored in ethical governance, EU regulatory alignment, and an expanding landscape for innovation. With firm institutional commitments, including ongoing work to adapt to the EU AI Act and strategic instruments such as the 'Policy for the Development of Artificial Intelligence in Poland from 2020' (updated in 2024), Poland is laying a robust foundation for responsible and inclusive AI deployment that balances social safeguards with economic advancement.

Poland scores strongly on digital infrastructure and data governance, supported by its expanding open-data culture and the increasing adoption of advanced data management practices by companies. Initiatives such as the proposed regulatory sandboxes—real-world regulatory testing environments—position Poland to scale AI deployment across priority sectors including finance, industry, logistics, medicine, and e-commerce.

The country's human-centric model, emphasizing ethical implementation and administrative competence, reflects a deliberate effort to ensure AI systems are transparent, explainable, and consistent with democratic values.

Still, structural challenges remain. Poland's moderate technology sector score points to the need for greater commercial translation of AI research and stronger linkages between academia and industry. While the National Centre for Research and Development (NCBR) plays a key role in funding AI-related R&D projects, and there's dynamic growth in AI and big data start-ups, scaling remains uneven. Enhancing venture funding, talent retention, and support for SMEs will be critical to accelerating AI innovation and adoption, particularly outside established research clusters.

To realize its strategic vision, Poland must deepen regional ecosystem coordination and support a broader base of indigenous AI capabilities. Focused investments in digital skills and administrative competence, along with inclusive training and reskilling programmes, are key to building a future-ready workforce. Continued backing of innovation hubs, and cross-sector sandboxes will also help unlock AI's transformative potential in both economic and societal terms.

Poland's strong engagement in international governance—via the OECD and EU initiatives like the AI Act—further enhances its ability to shape globally aligned AI norms. With a policy agenda that tightly links AI to economic competitiveness and public sector modernization, Poland is well-positioned to influence emerging standards for interoperable and responsible AI. If supported by continued cross-sector coordination, agile regulatory development, and targeted public-private investment, Poland can establish itself not only as a committed EU-aligned regulator—but as a rising leader in dynamic, ethical, and mission-driven AI innovation. The direction is sound—the imperative to scale up is urgent. Now is Poland's moment to lead responsibly and ambitiously.

Appendix A:

Expert Vignettes

This appendix presents short expert vignettes that illustrate how Poland's institutional landscape for AI oversight, coordination and policy implementation operates in practice. Each vignette is written from the perspective of a typical actor and highlights institutional responsibilities, accountability arrangements and multi-stakeholder mechanisms that shape trustworthy, inclusive and adaptive AI governance

Paula Skrzypecka, *Senior Lawyer*, Creativa Legal

Polish companies fear AI not because of the technology itself, but because of legal uncertainty. Businesses need end-to-end frameworks: from risk classification, through documentation, to monitoring – designed for real operations, not abstract requirements.

Biography

Paula Skrzypecka – PhD, specializes in new technologies and IT law, with a particular focus on personal data protection and the legal aspects of cybersecurity. Her work focuses on a pro-business approach and support in the implementation of AI (including the creation of solutions for the medical and financial markets), data governance policies, and the legal data transfers.

Jacek Kotarbinski, *Pracodawca*, kotarbinski.com

The report accurately assesses that Poland is rapidly developing its AI ecosystem, strengthening infrastructure and compliance with the AI Act, yet still struggles with skill shortages and limited commercialization of innovation.

Biography

Jacek Kotarbinski, PhD is a recognized authority and international marketing, branding, innovation, and sales expert. Mentor to startups and technology companies. Since 1990, he has supported the development of business competitiveness. Repeatedly listed in rankings of the most important Polish Marketing Personalities ("Widoczni.com"), in the TOP30 of Polish marketing (Wirtualne Media), and among the 100 most inspiring people in the interactive industry in Poland (Whitepress). Recognized by LinkedIn as one of the most influential individuals. Winner of the 2012 Onet.pl Blog of the Year award (category: "Professional and Business Blogs") and First Prize for marketing strategy in the banking sector.

Wojciech Wołoszyk, *CEO*, IURIDICO LSP

Poland's AI governance risks confusing marketing promises with operational reality. We need less sloganeering, more domain-specific risk analysis – yet initiatives like BIELIK AI show Polish innovation can lead when unencumbered.

Biography

Wojciech Wołoszyk (Wołoszyk) is CEO of IURIDICO LSP | Chairman of POLOT – Polish Association of LSPs | Lawyer-linguist | Court-appointed expert in legal linguistics | Specialist in AI-generated text detection, Polish legal terminology, and AI's impact on language services in judicial contexts

Appendix B: OECD AI Progress Report

This note summarises the OECD country note on Poland's progress implementing AI laws and related legal/institutional measures. Poland has recently moved from strategy-setting to concrete legal and governance preparation for the EU AI Act:

In late 2024 the government announced a cross-government AI Council and an Artificial Intelligence Fund (~EUR 235 million / PLN 1 billion), and has embedded AI priorities in a new national digitalisation strategy — steps that signal an active push to align national institutions, finance and policy with forthcoming EU rules. Institutional responsibility for AI policy sits at the Chancellery of the Prime Minister (with the Ministry of Digital Affairs playing a central role) and a large multi-stakeholder working group (GRAI) has been mobilised to prepare substantive legal and regulatory inputs — including work specifically on implementation of the EU AI Act. A draft national Artificial Intelligence Development Policy (to 2030) has also been prepared and entered consultation in 2025, showing continuing legislative and regulatory attention.

Strengths (legal / governance focus)

- **Clear whole-of-government coordination:** AI policy and legal preparedness are being driven from the Chancellery with the Ministry of Digital Affairs and a Council/committee structure to steer implementation — a useful institutional anchor for translating EU obligations into national law and enforcement arrangements.
- **Dedicated legal-policy advisory capacity (GRAI):** The national Working Group on AI (GRAI) brings government, academia, industry and civil society experts together and explicitly lists “AI and legal regulations (including the implementation of the EU AI Act)” among its tasks — strengthening technical support for drafting, consultation and guidance.
- **Funding and signalling for regulatory delivery:** The creation of an Artificial Intelligence Fund and other targeted investments signal political will and resource backing that can be tied to compliance, capacity building for authorities, and establishment of enforcement and conformity-assessment mechanisms.
- **Policy drafting and consultation underway:** The publication and consultation of a draft national AI development policy (2025–2030) provides a platform to specify legal transposition steps, national enforcement responsibilities, and timelines for complementary national rules or guidance.

Constraints and risks (legal / enforcement perspective)

- **Implementation vs. timetable risk:** Preparing national implementing measures and enforcement capacity (notably conformity assessment, market surveillance, and judicial/administrative remedies) is resource-intensive — the pace of parliamentary or administrative action may lag the operational needs of businesses and public bodies expected to comply.
- **Enforcement capacity and clarity of responsibilities:** While governance bodies are in place, it remains critical to clarify which domestic authorities will be responsible for oversight, inspections, and penalties under the EU AI Act framework and to ensure they have budgets, staff and technical expertise. The OECD note highlights institutional arrangements but indicates work remains to operationalise enforcement.
- **Translating technical standards into practice:** National advisory and R&D initiatives are strong, but converting technical guidance (e.g., conformity

procedures, testing protocols, auditing standards) into legally binding national instruments or accredited conformity bodies will require explicit legal/regulatory follow-through.

- **Stakeholder transparency and public reporting:** Effective legal implementation needs publicly available registries, impact-assessment disclosure and clarity on enforcement outcomes — areas where the OECD highlights scope for stronger, regular public reporting tied to legal compliance.

Practical recommendations (constructive next steps for law implementation)

1. **Define and resource national enforcement authorities now:** Decide and publish which agencies will act as national competent authorities, market surveillance and penal bodies for AI Act implementation, and allocate dedicated budgets and technical teams (including labs for conformity checks). This reduces ambiguity and speeds up enforcement readiness.
2. **Translate GRAI outputs into formal legal instruments and guidance:** Use the GRAI's technical recommendations to produce standardised guidance (conformity routes, documentation templates, sectoral interpretative notes) and fast-track those into ministerial regulations or guidance memos that have legal weight for regulated actors.
3. **Set up accredited conformity and testing pathways early:** Pair R&D and HPC investments with an accreditation roadmap for conformity assessment bodies and testbeds so that providers and procurers know how to demonstrate compliance in practice. Link public procurement to certified conformity results to create market incentives.
4. **Publish a clear timetable and transparency plan:** Release a public schedule mapping EU AI Act milestones to national transposition steps, and commit to regular public reporting on inspections, conformity decisions and any enforcement actions to build trust and legal predictability.
5. **Invest in authority capacity building (legal + technical):** Direct part of the AI Fund to train regulators, judges and market surveillance teams in AI-specific legal issues (risk classification, documentation review, technical audits) and set up secondment schemes with research centres and PL-LLM projects to bridge technical gaps.

Overall assessment

The OECD country note presents Poland as a country moving decisively from strategy to legal and institutional preparedness: political commitments (AI Fund, cross-government AI Council), centralised coordination at the Chancellery and a large expert working group (GRAI) give Poland a solid platform to implement the EU AI Act and related national measures. The near-term challenge is operational — converting advisory outputs, funding and institutional architecture into clearly assigned enforcement roles, accredited conformity pathways and publicly verifiable enforcement activity so legal obligations become practicable and predictable for businesses, public bodies and citizens. Continued emphasis on resourcing authorities, publishing clear timetables and fast-tracking conformity/assessment arrangements will determine whether Poland turns its strong strategic posture into effective legal implementation.
